ABSTRACT
The evidence that the strength of any body provide nuclear forces of gravity. The nuclear force of gravity generated by the essential micro vortices. The vortex creates a pressure gradient in the ether. The pressure gradient is the source of nuclear energy. The nuclear force of gravity on the surface of the cores is equal for all elementary particles.

Keywords: Theory of atomic vortex gravitation, cosmology and cosmogony. Strength, mass and energy substances.

Gravitational Properties of Atom

INTRODUCTION
The strength of any substance is created interatomic forces of attraction. In modern science these are called electrostatic or quantum-mechanical. The nature of the interatomic forces, there are following types of communication in solids: ionic, covalent, metallic, hydrogen bond, Van der Waals forces [1].

In this paper we propose to consider a new model of the interatomic bonds. The interatomic forces of attraction is the atomic force of gravity. The proposed physical model is based on the theory of vortex gravitation, cosmology and cosmogony. The next chapter presents the basic principles of the theory of vortex gravitation.

VORTEX GRAVITY
In the theory, the vortex gravitation, cosmology and cosmogony states that outer space is of ether vortices. These vortices (torsion bars) created:
- Celestial bodies (objects) and elementary particles,
- The force of attraction between them.

Vortices and the corresponding body of different value. The largest terrestrial vortex, which can observe people it’s a universal vortex, the smallest nuclear.

The orbital speed of ether in each vortex decreases toward the periphery of the vortex according to the inverse square law. Speed of the ether is several orders of magnitude greater than the speed of light. The change of orbital velocity in a closed volume ether create in this volume is inversely proportional to the change in pressure. Reducing the pressure in a whirlwind, forcing all of the bodies, according to the law of Archimedes, to move in the direction of least pressure, that is, to the center of the torsion bar (atom). These Archimedian forces are the forces of gravity. Such a pattern acts the same in all essential vortices. The ether is super small dense gas. It consists of the smallest particles – amers [3]. Ether freely permeates any body or substance, except for super-dense bodies, which are the nuclei of atoms. Therefore, according to the law of Archimedes, the vortex gravitation force does not act on the body mass. These forces act on the total amount of nucleons in the body, which is in the vortex flow ether.

According to the vortex cosmogony, the atom was created micro vortices 1st order. In the center of atom vortex gravitational force achieves huge quantities. This force of gravity produces the same huge compressive force on ether's substances (amers) in the center of the vortex. Therefore, the substance in the center of the atomic vortex is condensed to the limit values and ether cannot penetrate it. This center is the nucleus of the atom. By the rotation of the ether near the surface of the nucleus, it acts the resistance of this surface. Therefore, on the lower orbits of the atomic vortex, turbulence occurs and vortices even smaller 2-th order. Micro vortices 2-nd order less micro vortices 1-th order to an enormous
value. Micro vortices 2nd order creates ultrafine particles of appropriate size. These particles create the substance of the atom, which surrounds the nucleus of the atom.

As the distance from the atomic nucleus vortex gravitation force decreases. Therefore, the substance of the atom, outside of its nucleus, also reduces its density is proportional to the force of gravity and the distance from the center of the atom. Consequently, the flow of atomic vortex freely permeates the matter outside the nucleus of an atom. Based on the above it can be concluded that the force of atomic attraction begins to have effect from the surface of the atomic nucleus and decreases in accordance with the classical law of inverse square distance from the center of the atom. In modern physics it is argued that the density of substance nucleons is the same in all elementary particles [4] [5]. This claim corresponds to the proposed atomic model. As mentioned above, the density of the nucleus and the force of compression or force of gravity on the surface of the nuclei should be maximum and equal for all atoms (substances).

In the theory of vortex gravitation [2] derived the following equation to determine the strength of the vortex gravitation, including atomic:

\[ F_g = V \times \rho \times \frac{V}{r} \]  \hspace{1cm} (1), \hspace{0.5cm} \text{from} \hspace{0.5cm} \frac{F_g}{V} \times r \]  \hspace{1cm} (2), \hspace{0.5cm} \text{where} \hspace{0.5cm} V - \text{volume of nucleons, which is the strength of the vortex gravitation}, \hspace{0.5cm} V_r - \text{the speed of the orbital circulation of ether on a given orbit}, \hspace{0.5cm} r - \text{the radius of the orbit, which is determined by the strength of the vortex gravitation}, \hspace{0.5cm} \rho = 8.85 \times 10^{-12} \text{ kg/m}^3 \hspace{0.5cm} \text{is the density of ether [3].}

The above proposed gravitational principle of creation and the existence of atoms and atomic nucleus in modern science is not studied. Consequently, there is no calculation principles of interatomic forces of attraction based on the concept of gravity.

The following chapter provides a review of the calculation of atomic forces of gravity. Interatomic attraction force determined, not energy.

THE NUCLEAR GRAVITY

The strength of the vortex, atomic gravity depends on the speed of rotation of the whirlwind atomic ether (Equation 1). We define this rate for an atomic, etheric vortex uranium, based on experimental properties.

1. The limit tensile strength of uranium \( \sigma_B = 37 \text{ krt/mm} \)
2. The number density of uranium \( \rho_u = 19100 \text{ krt/m}^3 \)
3. The mass of an atom of uranium
\[ m_{au} = 238 \text{ a.m.e. x } 1.66 \times 10^{-25} \text{ kgr} = 395 \times 10^{-27} \text{ kgr} [6] \]
4. The number of atoms in 1 m³
\[ \sum a_{1m}^2 = \rho_u / m_{au} = 19100/395 \times 10^{-27} = 48.4 \times 10^{27} \]
5. The number of atoms in the plane of the cross section of uranium with an area of 1 m²
\[ \sum a_{1m}^2 = (48.4 \times 10^{27})^{2/3} = 13.2 \times 10^{18} \]
6. The same in-plane area of 1 mm²
\[ \sum a_{1mm}^2 = (13.2 \times 10^{18})/10^6 = 13.2 \times 10^{12} \]
7. The limit of tensile strength for a single atom
\[ \sigma_B = \sigma_B / \sum a_{1mm}^2 = 37/13.2 \times 10^{12} = 2.8 \times 10^{12} \]
8. Assuming that the gravitational force of atoms \( F_{aa} \) equivalent tensile strength of the substance, taking into account
\[ F_{aa} = \sigma_B = 2.8 \times 10^{12} \]
9. The number of atoms in the linear dimension of 1 m
\[ \sum a_{1m}^2 = (\sum a_{1mm}^2)^{1/3} = (48.4 \times 10^{27})^{1/3} = 3.64 \times 10^{9} \]
10. The interatomic distance \( R_{aa} = 1m / \sum a_{1m} = 1/ \sum a_{1mm} = 1/3.64 \times 10^9 = 2.7 \times 10^{-10} \text{m} \)
11. The mass number of the nucleus \( A = 395,1 \)
12. The radius of the nucleus of an atom
\[ R_a = 1.4 \times 10^{-15} \times (A)^{1/3} = 1.4 \times 10^{-15} \times (395,1)^{1/3} = 10^{-14} \text{m} \]
13. The volume of the nucleus of an atom
\[ V_A = 4/3 \pi R_a^3 = 4/3 \times 3.14 \times (10^{-14})^3 = 4.2 \times 10^{-42} \text{m}^3 \]
14. Substitute in equation (2) known values \( V_a \), \( R_{ab} \), \( \rho \). Determine the speed of the ether \( v_r \) on the interatomic distance (orbit \( R_{ab} )
\[
\nu_r = \frac{F_{ab} \times R_{ab}}{v_a \times \rho} = \frac{2.8 \times 10^{-23} \times 2.7 \times 10^{-10}}{4.2 \times 10^{-12} \times 8.85 \times 10^{-12}} = 0.45 \times 10^{18} \text{ m/s}
\]

On the basis of the relationship between the orbital velocity of the ether from the radius of the orbit of \( \frac{V}{v} \), determined by the speed of rotation of the ether on the surface of the nucleus
\[
\frac{\sqrt{R_{ab}}}{\sqrt{R_n}} = \frac{2.7 \times 10^{-19}}{10^{-24}} = 164 \quad \text{тогда} \quad v_r = 0.45 \times 164 = 7.4 \times 10^{17} \text{ m/c}
\]

15. Orbital velocity of the ether \( v_r = 0.45 \times 10^{14} \text{m/s} \) creates the following the strength of the vortex gravitation on the interatomic distance
\[
F_{aa} = \frac{\rho \times V^2 \times V_a}{R_{ab}} = \frac{6.85 \times 10^{-12} \times (0.45 \times 10^{14})^2}{2.7 \times 10^{-10}} \times V_a = 6.5 \times 10^{29} \times V_a
\]

16. Defined vortex force of gravity on the surface of the nucleus, based on the inverse square law of distance \( F_n / F_a = R_a / R_n \):
\[
F_n = \frac{F_{ab} \times R_{ab}^2}{H_{ab}} = \frac{6.5 \times 10^{29} \times V_a \times (2.7 \times 10^{-10})^2}{2.7 \times 10^{-10}} \times V_a = 4.7 \times 10^{28} \times V_a
\]

The same scheme is defined the force of gravity on the surface of the atomic nuclei for other substances. The results are shown in table 1

<table>
<thead>
<tr>
<th>Name</th>
<th>Gold</th>
<th>Copper</th>
<th>Silver</th>
<th>Uranium</th>
<th>Platinum</th>
</tr>
</thead>
<tbody>
<tr>
<td>( F_n )</td>
<td>2.1 \times 10^{38} \times V_A</td>
<td>1.2 \times 10^{39} \times V_A</td>
<td>4.5 \times 10^{38} \times V_A</td>
<td>4.7 \times 10^{38} \times V_A</td>
<td>3.4 \times 10^{38} \times V_A</td>
</tr>
</tbody>
</table>

The atomic value of gravity at the surface of nuclei of various substances (table. 1) equal, in the same order.

**Note 1.** The calculation of gravitational forces of an atom of uranium – not complete and not accurate as it does not include the gravitational force from other neighboring atoms and are based on experimental values.

**Note 2.** The calculation of gravity, atomic forces on the classical laws of gravity (Newton’s theory and Einstein’s) is impossible, since in these theories the source of gravitational forces are the masses of the bodies, measured in kilograms. Therefore, the results of calculations according to the classical equations differ from the actual values tremendously. For example determine the force of attraction between the atoms of uranium on the basis of the equation of universal gravitation Newton:
\[
F_s = G \times \frac{m_1 \times m_2}{r^2} = 6.67 \times 10^{-11} \times \frac{(395 \times 10^{-27}) \times (395 \times 10^{-27})}{(2.7 \times 10^{-18})^2} = 1.4 \times 10^{-40} \text{u}
\]

(3)

On the basis of Newton’s equations the magnitude of the nuclear gravitation \( 1.4 \times 10^{-40} \) to \( 10^{28} \) times smaller than the actual, experimental \( 2.8 \times 10^{-12} \). Thus known classical gravitation theory for the study of microparticles cannot be used. So have any new concepts interatomic attraction.

**NUCLEAR ENERGY**

The velocity gradient of ether in the nuclear whirlwind (the torsion bar) creates not only the force of gravity, but acts as a source of energy. The article “the Equivalence of energy and mass of atomic energy” [7] on the basis of the equation Mendeleev – Clayperon shows a property of a gaseous medium (ether) with the pressure to create energy. Selected energy \( E \) is determined by the equation:
